
The hygienic alternative to metal

The hygienic alternative to metal

FabricAir ducts are 100% polyester, making them a hygienic choice for your air distribution. Polyester is a thin plastic thread that does not absorb water. This makes it impossible for bacteria to live "inside" of the fiber and should any dirt accumulate on the surface of the duct, it can simply be washed. If you have an application that is likely to deposit harmful bacteria on the duct, such as food processing, you have the option of specifying one of our anti-microbial polyester ducts. These unique qualities make FabricAir dispersion systems the preferred choice in slaughterhouses, laboratories, professional kitchens and any other location with strict hygienic requirements.

Maintenance made easy

Most of the time, FabricAir duct maintenance requires nothing more than changing the filter at the air-handler.

If your facility maintenance has fallen...
